

Scope Card — Home Pantry Tracker

#	Component	Value
1	Industry + product	Quick Commerce - Blinkit
2	Target user	23–35 year old working professional earning ~₹1L/month in metro cities, living with household help (cook/helper) who manages the kitchen. They don't actively track groceries themselves — they find out something is over only when the cook tells them.
3	AARRR stage	Retention (Primary) Revenue (Secondary)
4	Feature /Flow.	A virtual shelf that auto-populates whenever a user orders groceries to their home address on Blinkit. The shelf tracks estimated stock levels based on (a) Blinkit order history and (b) category-level consumption benchmarks sourced from subscribe-and-save patterns (e.g. Amazon Subscribe & Save reorder intervals). On first setup, the app asks "How many people live at your home?" to calibrate consumption rate. Users get reminders before items are predicted to run out, with a one-tap reorder.
5	Metrics	Primary: D14 retention rate / weekly active sessions. Secondary: Avg. orders per user per month, Reorder conversion rate from reminders.
6	Hypothesis	I believe that automatically tracking home grocery stock for working professionals who rely on household help will reduce unplanned stockouts and create a habit loop around Blinkit — measured by improvement in D14 retention rate and increase in average monthly orders per user.
