

The One-Page Research Plan

Six fields. Fill them before you talk to anyone.

Field	What goes here
Research question	How much lead time do users need before a predicted grocery shortage for an early alert to feel useful rather than premature or too late?
What I assume now	I assume users need at least 2-3 days of lead time before a predicted shortage to act on an alert comfortably — because Blinkit's delivery is fast (10-30 min), but people don't want to reorder reactively every time; they'd rather batch it into a planned order.
Primary method + why	Primary method: User interviews — because the question needs people to reflect on and explain their sense of timing/urgency, not pick from options I'd have to guess at in advance.
Secondary / triangulation source	Secondary method : User Survey, CROSS check how many people are having the same problem. App Store Reviews To check same thing.
Who I'll talk to	23-35 year old working professionals in urban cities like Bangalore, who use a quick commerce platform regularly for groceries, have a cook managing the kitchen
"Enough" signal	Stop interviewing when the last 2-3 people give you roughly the same answer on lead time (like, everyone's landing around "next-day" or everyone's saying "same-day is fine")
